Why a Drydock?

The Bureau of Fisheries has made a study of the age-long shipping problem of barnacles and finds that American shipping owners, including Uncle Sam, pay as much as one hundred million dollars for the ton of barnacles that attach themselves to vessel bottoms. A ship at sea from six to eight months accumulates a growth of from two to three inches, weighing from fifty to one hundred tons. The results are loss of speed, fuel consumption, delayed voyages, wear of machinery and drydock inactivity.—Navy News.

While a Canadian Pacific railroad train en route across the continent was making a ten minute stop at Schreiber, Ontario, divisional point between Chapleau and Fort William, the other day, an Australian government official went into a telephone booth in the station and put in a telephone call to his homeland. This was accomplished while the train was making its customary stop, and it was not necessary to hold the train for the government official to send his important message to Australia.

November milk prices, according to the Michigan Milk Messenger, will remain at \$1.48 per cwt. for the 80 per cent base on the Detroit market. School teachers in the Hungarian village of Lentihegy were shocked when their young pupils, some of them only five or six years old, began to bawl and shout and staggering to their desks, gave every evidence of being very drunk. An "electric chair" for mosquitoes and other insects and pests was recently devised at a tree research laboratory. The "chair" is a large square with two sides made of extremely fine wire. A current is passed through these sides, killing all insects alighting thereon. A weak current is used, running from an electric bulb socket through a transformer into the wire gauze. During the day bait is used to attract the insects; at night a light is placed inside the "chair".—New York Times.
